Prompt

/plan This is specific to a Boons.io startup and this session will be specific to the customer ask and the technical solution discussion. Go thru the new website content from /Downloads/Tacos-jalisco folder. The current customer website - <https://tacosjaliscovallejo.com>. Ask from customer is to create 2 new forms for Events & "We are hiring" to include a form, When user submit the form send a sms + email to the restaurant owner. Here are the restaurant contact - ernesto@mvicorp.net and mobile# +1 (707) 647-0554. In addition to this context, we already have the required APIs in /Users/chakra/Documents/icloud-archive-folder-back-up/Documents/Projects/04_ITB/repos/boons-notification-api Chakravarthys-MacBook-Pro:boons-notification-api (Refer SMS and email API structures and understand about the req/res and payload details). With this context and ask from customer, I want to design a solution for this customer ask. **Interview me with your queries regarding the any technical and functional needs.** I want you to design a specific solution for this customer with all resources and I **do not want to over complicate the solutions as well as do not want to compromise on the security.** **Lets first plan and design a version of solutions and produce the design doc in a separate /doc folder in this current folder path**

Currently hosted website artifacts (created using Claude) are hosted in AWS S3 and connected with domain using Route53 and CloudFront

Internally as a team we discussed on 2 approaches. A - Create a lightweight SDK which can get included across all static websites, where it will dynamically inject the required form specific to a template and fields configured in the back office system as well this SDK will create an iframe to fire the Boons internal APIs. (if we no longer open for all CORS as well as fix the AUTH). This will be a overkill for this customer specific use cases. B - Create a lightweight monolithic Node.js (Express.js or Next.js) based app where we can still host the same HTML artifacts with the forms,

on submit of a form, it fires internal API (hosted in same repo) which in turn fires this notification API as a BE to BE API services. IMO, integrating the Boons-notification API directly will expose these APIs and it is a risk.
